

# Function spaces involving means and mean oscillation

Galia Dafni

Concordia University

We consider spaces which are defined using mean oscillation, including the John-Nirenberg (JNp) spaces, and the weak-type spaces on the upper half-space recently considered by Frank. We introduce dyadic analogues and variations involving means instead of mean oscillation and study their relationships to other spaces.

In Special Session 1 on Applied Harmonic Analysis and Operator Theory at the Mathematical Congress of the Americas 2025.
