

Frames by orbits of bounded operators

Carlos Cabrelli

Universidad de Buenos Aires CONICET IMAS

We will survey known results and present new findings that settle the problem of existence and characterization of frames generated by orbits of bounded operators on separable Hilbert spaces. This talk will provide a comprehensive solution to the question of which operators admit such frames, a problem motivated by Dynamical Sampling, a field within signal processing and sampling theory.

In Special Session 1 on Applied Harmonic Analysis and Operator Theory at the Mathematical Congress of the Americas 2025.
