

Strict concavity properties of cross covariograms

Almut Burchard

University of Toronto

The cross covariogram of two convex bodies K, L is the volume of the intersection of K with $v+L$, as a function of the translation vector v . This function is known to be log concave; here I will present precise conditions for *strict* log concavity. (Joint work with Gabriele Bianchi and Lawrence Lin)

In Special Session 12 on Harmonic Analysis in Geometric Tomography at the Mathematical Congress of the Americas 2025.
