

Critical Sobolev inequality: stability and break of symmetry

Filomena Pacella

La Sapienza University of Rome

We present a quantitative Sobolev inequality in cones, of Bianchi-Egnell type, which implies a stability result. It holds whatever the minimizers of the Sobolev quotient are, radial or nonradial. As time permits, the optimal constant for it will be discussed.

In Special Session 20 on Advances in Nonlinear PDEs, Analysis and Geometry at the Mathematical Congress of the Americas 2025.
