

Polynomial growth for derivatives of one-dimensional diffeomorphisms.

Andrés Navas

Universidad de Santiago de Chile

Polterovich and Sodin proved that the growth of derivatives of interval diffeomorphisms is at most quadratic. We will see that, in case of a non-quadratic tangency to the identity at a topologically repelling fixed point, the growth is exactly quadratic. We will also discuss the growth of higher-order derivatives along iterates.

In Special Session 22 on Partially Hyperbolic Dynamical Systems: Ergodic and Topological Aspects at the Mathematical Congress of the Americas 2025.
