

The unoriented Bogomolov multiplier

Carlos Segovia

SECIHTI UNAM-Oaxaca

We define an obstruction in a geometrically manner to extend a free action of a finite group over an unoriented surface to a non-necessarily free action over a 3-manifold. We can show counterexamples of free-action over unoriented surfaces that do not extend. In addition, we discuss algebraic implications related to a certain Noether problem.

In Special Session 29 on Interactions of Equivariant Bordism and Low Dimensional Topology at the Mathematical Congress of the Americas 2025.
