

The exterior of hyperbolic knots of circular width 3

Araceli Guzmán Tristán

CIMAT

We give a description of the pieces in a decomposition by disjoint and non-isotopic Seifert surfaces of the exterior of a hyperbolic knot of circular width 3. We also illustrate different decompositions with some families of knots. This is a joint work with M. Eudave-Muñoz, F. Manjarrez-Gutierrez and E. Ramírez-Losada.

In Special Session 31 on Structures of Submanifolds in Low Dimensional Topology at the Mathematical Congress of the Americas 2025.
