

Bireducible Dehn fillings

Kenneth Baker

University of Miami

A pair of Dehn fillings along a single torus boundary component of an irreducible 3-manifold that each yield a reducible manifold is called a bireducible Dehn filling pair. We present a simple construction that subsumes and extends all known examples of hyperbolic manifolds with bireducible Dehn fillings in the literature.

In Special Session 31 on Structures of Submanifolds in Low Dimensional Topology at the Mathematical Congress of the Americas 2025.
