Closed geodesics on surfaces: topology, geometry, arithmetic

Francisco Arana-Herrera

University of Maryland, College Park

Closed geodesics on surfaces can be studied from different points of view: topology, geometry, arithmetic. In this talk we discuss the question of how homologically complicated are long simple closed geodesics on hyperbolic surfaces. The approach of the discussion is via Teichmüller dynamics. This talk encompasses joint work with Giovanni Forni and Pouya Honaryar.

In Special Session 34 on Randomness in Low-Dimensional Geometry at the Mathematical Congress of the Americas 2025.
