

On geometrical embeddings of trees

Konstantin Tikhomirov

Carnegie Mellon University

Let X be any k -dimensional normed space, and let n, d be parameters. Can every n -vertex tree of maximal degree d be embedded into X geometrically, that is, in such a way that the distance between adjacent vertices is at most one, and the distance between non-adjacent vertices is strictly greater than one? We give an essentially complete answer in the setting of bounded (constant) d .
