

The permutation group of Reed-Solomon codes over arbitrary points and their tensor product

Hiram H. López

Virginia Tech

In this talk, we will see how the permutation group of a Reed-Solomon is given by the polynomials of degree one that leave the set of evaluation points invariant. Then, we will see how to extend the result to the permutation group of the tensor product of Reed-Solomon codes.

In Special Session 40 on Network Coding and Related Fields at the Mathematical Congress of the Americas 2025.
