

CLT for 1D stochastic wave equations with Lévy noises

Guangqu Zheng

Boston University

In this talk, we will present central limit theorems for 1D stochastic wave equations with pure-jump Lévy white noise. This talk is based on joint works with R.M. Balan (Ottawa) and the results are motivated by recent active research on limit theorems for stochastic partial differential equations driven by Gaussian noises.

In Special Session 45 on Stochastic Partial Differential Equations at the Mathematical Congress of the Americas 2025.
