

Strong approximation of stochastic wave equation by an explicit exponential-type integrator

Hugo de la Cruz

FGV-School of Applied Mathematics, Rio de Janeiro

We propose an explicit exponential-type integrator for the approximation of the stochastic wave equation. The strong convergence of the full discretization is analyzed, and the method's suitability for preserving a geometric property of the exact solution is examined. Numerical examples illustrate the theoretical results.

In Special Session 45 on Stochastic Partial Differential Equations at the Mathematical Congress of the Americas 2025.
