

Modeling the Energy Allocation Hypothesis of Sleep

Janet Best

Ohio State University

A hypothesis of state-dependent metabolic partitioning and metabolic constraints, interacting with the circadian system, serves as the basis for a mathematical model of sleep-wake regulation. The model predicts that individuals can adjust to a range of sleep schedules. Bifurcations in the system have implications for the network underlying sleep-wake regulation.

In Special Session 49 on Bifurcations at the Mathematical Congress of the Americas 2025.
