

Stochastic Rumors on Graphs

Pablo Rodríguez

Federal University of Pernambuco (Brazil)

In this talk, I will present recent results on stochastic rumor models in graphs. The model is an interacting particle system based on the well-known Maki-Thompson rumor model, one of the earliest mathematical models used to describe the spread of a rumor in a homogeneously mixed population. I will discuss about recent results for this model on different graphs and highlight some open problems.

In Special Session 51 on Discrete Stochastic Models and Applications at the Mathematical Congress of the Americas 2025.
