

Discussions on Berger's Conjecture

Sarasij Maitra

The University of Utah

We discuss some progress on a long-standing conjecture of R. Berger concerning the torsion submodule of the module of differentials over a complete one dimensional local domain. This is based on joint work with Craig Huneke and Vivek Mukundan. If time permits, we also discuss how the tools that we implemented in this investigation led to more independent research questions.

In Special Session 56 on Recent Developments in Commutative Algebra at the Mathematical Congress of the Americas 2025.
